

SUMMARY

An electrically operated door opener, with a swivelable swing trap for blocking or releasing of a door side switch trap, with a movable control lever, and a change-over, has been described, which can move into a position that blocks the swing trap and into a position that releases the swing trap, and is so arranged with the control lever, that the change-over into the blocking position can be locked by means of the control lever. Furthermore, there is a position indicator for moving the control lever for releasing or locking the change-over. The position indicator has an electromotor, on the motor axis of which an eccentric cam is mounted. The electromotor is mounted with a control lever, so as to hit the centrifugal cam against the control lever on activation of the electromotor due to the rotation of the motor axis, causing the control lever thereby to move.
